Pre-Observational vs Observed Spectrum
Factor 1/33 compression from measurement
Pre-observational $f_k = f_0\varphi^k$
Observed $f_k^{obs} = f_0\varphi^k/33$
Compression = 1/N = 1/33
Frequency (normalised)
Shell index k
EM vs Acoustic Scaling
$\mathbb{RP}^4$ measurement selects EM window
Acoustic (macroscopic obs.)
EM (quantum collapse → /33)
Compression gap (×33)
Frequency (normalised)
Shell index k
